

Kidney Patients Need Certain Vaccines

- Are you over 65 years old?
- Do you have kidney disease?
- Do you take one or more medicines regularly or have diabetes, high blood pressure, or heart disease?
- Do you have a weakened immune system?
- Do you live or work in healthcare or in a correctional or group living setting?
- Will you be traveling outside of the United States?

If you answered “Yes” to any of these questions, you are probably due for one or more vaccines.

To protect yourself and the people around you, ask your health provider about the vaccines you may need.

COVID-19

If you get COVID-19 disease, you will be much less likely to get very sick, be hospitalized or die.

FLU

All adults need this every year.

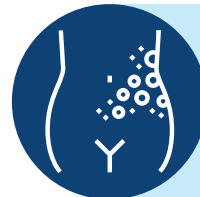

TETANUS, DIPHTHERIA & PERTUSSIS

This combo vaccine protects you from whooping cough. It also has the tetanus booster needed every ten years.

PNEUMONIA

People over 65 or people with long-lasting conditions like diabetes or kidney disease, need protection against pneumonia, one of the top causes of death.

HEPATITIS B

Hepatitis B is spread by contact with infected blood. Kidney patients, as well as those with diabetes and other conditions, need this vaccine.
